Developing new service models in
CAMHS, social care and education

What is NVR?

NVR stands for Non Violent Resistance

Increasingly, professionals in child mental health found that traditional therapies were ineffective for dealing with serious behaviour problems in children and young people, such as aggression and violence, running away, truanting, stealing, drug-taking, criminal involvement and putting themselves at serious risk in dangerous environments outside the family home. Helpless, humiliated, scared of their child or angry at them, parents seeking support from professionals can feel even more despondent because of their child's refusal to cooperate in therapy.

Professor Haim Omer at the University of Tel Aviv started developing a new approach to these behaviours, helping parents to increase their "parental presence". This approach uses methods within the family, which originated in the nonviolent political struggles that had been led by Martin Luther King and Rosa Parks. None of these methods rely on the participation or cooperation of the child or young person – parents and their supporters take one-sided action. Like these activists, parents are coached in de-escalating and reducing conflict, but whilst taking back space in the family home and refusing to give in to unreasonable demands. Parents reach out and reconcile with their child using very specific methods.

Having felt isolated, parents now learn to engage and cooperate with other adults. These may be drawn from the extended family, friends or the community. In this way, they "grow" a community of support around them, which helps to resist the problematic and self-destructive behaviour of their child. From a position of strength, parents can begin showing their care for the young person, and address his or her unmet psychological needs.

'Working collaboratively
with people is more
effective than 'treatment'

Where can NVR be helpful?

Working collaboratively with NVR can be helpful wherever we find behaviour that has a controlling effect on others. Professionals are now coaching and therapeutically supporting parents and adoptive parents, teachers, foster carers and other adults who are engaged in the care or education of young people for a wide range of serious behavioural difficulties such as physical violence, verbal abuse, destruction of property, drug - and alcohol misuse, criminal activity and violent self-harm. NVR has also been successfully used in work with parents of gang members.

NVR-based work around young people with developmental trauma not only helps bring about behavioural improvement, but also reduces the risk of family or placement breakdown. Child-focused NVR helps these children and young people develop more engaged and integrated mental states.

NVR is increasingly being used in response to children, young people and young adults with anxiety-related difficulties, who do not cooperate in therapy and may become socially withdrawn, using e.g. the 'SPACE' model (Supportive Parenting for Anxious Childhood Emotions).

An emerging field is work with families of adults who show 'Adult Entrenched Dependency' (AED). These are adults who do not fulfil their potential, underperform, and do not engage in work, education or making contributions to the running of their parents' household they are living in. Many of these younger adults become extremely socially withdrawn. A growing, yet widely still unrecognised phenomenon, 'AED' can be linked to anxious avoidance of everyday challenges, more serious anxiety disorders, or enduring mental health problems such as psychosis. The tensions arising in families as a result of AED behaviour patterns tend to feed into highly charged angry and blaming communication, which in turn exacerbates psychotic symptoms. Dependent behaviour of younger adults, regardless of their mental health, undermines the development of life-stage appropriate autonomy.

Is NVR evidence-based?

Yes, it is. Working with nonviolence has changed the lives of many families, often inspiring them to change their outlook on relationships in general. Several controlled studies are now showing the efficacy of NVR, in terms of behavioural improvement of the child or young person, improvement of parental emotional well-being and mental health, and more constructive family interaction.

How is NVR delivered?

NVR is provided by family therapists, clinical psychologists and other mental health professionals who have been trained in the use of this approach. We have a team of highly qualified, experienced and skilled professionals within PartnershipProjects. If you are interested in working with us, we can provide our service either remotely or in-person (if location is not an issue).

To find out more please contact us via referrals@partnershipprojectsuk.com

Some of the diagnostic areas NVR is used in are:

- Conduct Disorder and Oppositional Defiant Disorder.
- ADHD
- ASD
- Phobias, OCD, Social Anxiety and other anxiety disorders – in combination with the SPACE model, and in working with Adult Entrenched Dependency
- Developmental Trauma, Attachment Disorders, and aggression associated with PTSD – using child-focused NVR methods
- Eating Disorders
- Psychosis – where there is Adult Entrenched Dependency.
